

MoTriColor

Molecularly guided Trials with specific treatment strategies in patients with advanced newly molecular defined subtypes of Colorectal cancer

The four years project MoTriColor conducts **three clinical trials in colorectal cancer patients with advanced disease**, based on their specific molecular profiles

Objectives

- To stratify colorectal patients based on molecular signatures and matching them to specific therapies

- To perform 3 two-stage single arm multi center open-label phase II studies in molecularly selected patients
- To explore mechanism of response and resistance to the treatments
- To monitor circulating DNA in blood

Impact

- Three novel therapeutic strategies for CRC patients with advance disease
 - MoTriColor data: ground-breaking for further studies in CRC
 - Further clinical development in Europe
- Pioneering work leading to a first companion diagnostic (redictive) test in CRC: a cutting edge
 - Agendia: worldwide positioning in cancer diagnostics
